Core Set of Metadata for ISO 3901:2001 International Standard Recording Code (ISRC)

May 2003

CORE METADATA SET FOR ISRC

The current version of ISO 3901 has a placeholder for a standardized set of minimum metadata to be associated with an ISRC, at the ISRC Summit last October (2002) it was agreed that this minimum or core set of data would be required for the unique identification of the sound or music video recording. It would not be related to any particular application where ISRC associated data is needed.

IFPI is still working with the user community to agree on the elements for this Core Metadata Set will be.

IFPI proposes to issue this as a recommendation and seek its inclusion in the next five-year revision point.
